Introduction

About the project kit
Both the project kit and the supporting material have been carefully designed for use in KS3 Design and Technology lessons. The project kit has been designed so that even teachers with a limited knowledge of electronics should have no trouble using it as a basis from which they can form a scheme of work.

The project kits can be used in two ways:
1. As part of a larger project involving all aspects of a product design, such as designing an enclosure for the electronics to fit into.
2. On their own as a way of introducing electronics and electronic construction to students over a number of lessons.

This booklet contains a wealth of material to aid the teacher in either case.

Using the booklet
The first few pages of this booklet contains information to aid the teacher in planning their lessons and also covers worksheet answers. The rest of the booklet is designed to be printed out as classroom handouts. In most cases all of the sheets will not be needed, hence there being no page numbers, teachers can pick and choose as they see fit.

Please feel free to print any pages of this booklet to use as student handouts in conjunction with Kitronik project kits.

Support and resources
You can also find additional resources at www.kitronik.co.uk. There are component fact sheets, information on calculating resistor and capacitor values, puzzles and much more.

Kitronik provide a next day response technical assistance service via e-mail. If you have any questions regarding this kit or even suggestions for improvements, please e-mail us at:
support@kitronik.co.uk

Alternatively, phone us on 0845 8380781.
Schemes of Work

Two schemes of work are included in this pack; the first is a complete project including the design & manufacture of an enclosure for the kit (below). The second is a much shorter focused practical task covering just the assembly of the kit (next page). Equally, feel free to use the material as you see fit to develop your own schemes.

Before starting we would advise that you to build a kit yourself. This will allow you to become familiar with the project and will provide a unit to demonstrate.

Complete product design project including electronics and enclosure

<table>
<thead>
<tr>
<th>Hour</th>
<th>Activity</th>
</tr>
</thead>
</table>
| 1     | Introduce the task using ‘The Design Brief’ sheet. Demonstrate a built unit. Take students through the design process using ‘The Design Process’ sheet.  
  Homework: Collect examples of MP3 players & accessories. List the common features of these products on the ‘Investigation / Research’ sheet. |
| 2     | Develop a specification for the project using the ‘Developing a Specification’ sheet.  
  Resource: Sample of products (amplifiers & MP3 player accessories).  
  Homework: Using the internet or other search method, find out what is meant by ‘design for manufacture’. List five reasons why design for manufacture should be considered on any design project. |
| 3     | Read ‘Designing the Enclosure’ sheet. Develop a product design using the ‘Design’ sheet.  
  Homework: Complete design. |
| 4     | Using cardboard, get the students to model their enclosure design. Allow them to make alterations to their design if the model shows any areas that need changing. |
| 5     | Split the students into groups and get them to perform a group design review using the ‘Design Review’ sheet. |
| 6     | Using the ‘Soldering in Ten Steps’ sheet, demonstrate and get students to practice soldering. Start the ‘Resistor Value’ and ‘Capacitors Basics’ worksheets.  
  Homework: Complete any of the remaining resistor / capacitor tasks. |
| 7     | Build the electronic kit using the ‘Build Instructions’. |
| 8     | Complete the build of the electronic kit. Check the completed PCB and fault find if required using the ‘Checking Your Amplifier PCB’ section and the fault finding flow chart.  
  Homework: Read ‘How the Amplifier Works’ sheet. |
| 9     | Build the enclosure.  
  Homework: Collect some examples of instruction manuals. |
| 10    | Build the enclosure.  
  Homework: Read ‘Instruction Manual’ sheet and start developing instructions for the amplifier. |
| 11    | Build the enclosure. |
| 12    | Using the ‘Evaluation’ and ‘Improvement’ sheet, get the students to evaluate their final product and state where improvements can be made. |

Additional Work
Package design for those who complete ahead of others.
**Electronics only**

| Hour 1 | Introduction to the kit demonstrating a built unit. Using the ‘Soldering in Ten Steps’ sheet, practice soldering. |
| Hour 2 | Build the kit using the ‘Build Instructions’. |
| Hour 3 | Check the completed PCB and fault find if required using ‘Checking Your Amplifier PCB’ and fault finding flow chart. |

The Design Process

The design process can be short or long, but will always consist of a number of steps that are the same on every project. By splitting a project into these clearly defined steps, it becomes more structured and manageable. The steps allow clear focus on a specific task before moving to the next phase of the project. A typical design process is shown on the right.

Design brief
What is the purpose or aim of the project? Why is it required and who is it for?

Investigation
Research the background of the project. What might the requirements be? Are there competitors and what are they doing? The more information found out about the problem at this stage, the better, as it may make a big difference later in the project.

Specification
This is a complete list of all the requirements that the project must fulfil - no matter how small. This will allow you to focus on specifics at the design stage and to evaluate your design. Missing a key point from a specification can result in a product that does not fulfil its required task.

Design
Develop your ideas and produce a design that meets the requirements listed in the specification. At this stage it is often normal to prototype some of your ideas to see which work and which do not.

Build
Build your design based upon the design that you have developed.

Evaluate
Does the product meet all points listed in the specification? If not, return to the design stage and make the required changes. Does it then meet all of the requirements of the design brief? If not, return to the specification stage and make improvements to the specification that will allow the product to meet these requirements and repeat from this point. It is normal to have such iterations in design projects, though you normally aim to keep these to a minimum.

Improve
Do you feel the product could be improved in any way? These improvements can be added to the design.
The Design Brief

A manufacturer of MP3 players has developed an audio amplifier circuit. The circuit has been developed to the point where they have a working Printed Circuit Board (PCB). Although they are used to the design of MP3 players, they have not designed an amplifier case before.

The manufacturer would like ideas for an enclosure for the PCB, batteries and speakers to be mounted in. The manufacturer has asked you to do this for them. It is important that you make sure the final design meets all of the requirements that you identify for such a product.

Complete Circuit

A fully built circuit is shown below.
Investigation / Research

Using a number of different search methods, find examples of similar products that are already on the market. Use additional pages if required.

Name.................................................. Class.................................
Developing a Specification

Using your research into the target market for the product, identify the key requirements for the product and explain why each of these is important.

Which Batteries Should I Use With My MP3 Amplifier?

The amplifier will work off a supply of 2 volts to 15 volts, however you won’t be able to set the volume as high on the lower voltages. The higher the voltage, the more batteries you will need and the bulkier the case will have to be to accommodate them. You might also want to consider how long the amplifier would work for before the batteries need to be changed. Some options are shown in the table below:

<table>
<thead>
<tr>
<th>Picture</th>
<th>Description</th>
<th>Voltage</th>
<th>Capacity</th>
<th>Estimated life</th>
<th>Max power</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1.png" alt="3x AA" /></td>
<td>3x AA</td>
<td>4.5 V</td>
<td>1500 mA</td>
<td>2.4 days</td>
<td>0.4 W</td>
</tr>
<tr>
<td><img src="image2.png" alt="3x C cell" /></td>
<td>3x C cell</td>
<td>4.5 V</td>
<td>3000 mA</td>
<td>4.8 days</td>
<td>0.4 W</td>
</tr>
<tr>
<td><img src="image3.png" alt="4x AA" /></td>
<td>4x AA</td>
<td>6 V</td>
<td>1500 mA</td>
<td>1.2 days</td>
<td>0.75 W</td>
</tr>
<tr>
<td><img src="image4.png" alt="4x C cell" /></td>
<td>4x C cell</td>
<td>6 V</td>
<td>3000 mA</td>
<td>2.4 days</td>
<td>0.75 W</td>
</tr>
<tr>
<td><img src="image5.png" alt="6x AA" /></td>
<td>6x AA</td>
<td>9 V</td>
<td>1500 mA</td>
<td>18.8 hours</td>
<td>2.0 W</td>
</tr>
<tr>
<td><img src="image6.png" alt="1x PP3" /></td>
<td>1x PP3</td>
<td>9 V</td>
<td>150 mA</td>
<td>1.9 hours</td>
<td>2.0 W</td>
</tr>
<tr>
<td><img src="image1.png" alt="3x AA" /></td>
<td>3x AA</td>
<td>4.5 V</td>
<td>1500 mA</td>
<td>2.4 days</td>
<td>0.4 W</td>
</tr>
</tbody>
</table>

You will have to decide which of these is most important and select your choice of batteries accordingly:
- Compact case.
- Higher volume.
- Long battery life.

Please note that the estimated battery life has been calculated running the amplifier on standard alkaline batteries at full power, hence the higher power choices have a shorter battery life. Obviously if you don’t run your MP3 player at the maximum volume, the batteries will last longer.
Mounting the Speaker

To get the best performance from your amplifier, you will need to mount the speaker into an enclosure. If the speaker is left in open air, as the paper cone moves in and out, the air will move around the edge of the speaker, giving it poor performance. Try listening to the difference in audio quality with the speaker in the open air, and then cup your hands around the speaker. It is much better when you stop the air going around the edge of the speaker and force it to be pushed forward.

This is why it’s so important to mount the speaker. You will have to let the sound out and can design your own speaker grill, or simply you can use the example shown below.

The speaker grill pattern bellow has been designed for the speaker supplied. The three outer points have been designed as retaining points for holding the speaker in place.

The grill is printed to size and can be used when developing your enclosure design as well as for a template for drilling the holes when you are building your enclosure. The recommended drill size is 6mm, except for the three outer points, which may need to be different depending upon how these are used to secure the speaker.
Design

Develop your ideas to produce a design that meets the requirements listed in the specification.

Name..................................................  Class...........................................
Design Review (group task)

Split into groups of three or four. Take it in turns to review each person’s design against the requirements of their specification. Also look to see if you can spot any additional aspects of each design that may cause problems with the final product. This will allow you to ensure that you have a good design and catch any faults early in the design process. Note each point that is made and the reason behind it. Decide if you are going to accept or reject the comment made. Use these points to make improvements to your initial design.

Soldering in Ten Steps

1. Start with the smallest components working up to the taller components, soldering any interconnecting wires last.

2. Place the component into the board, making sure that it goes in the right way around and the part sits flush against the board.

3. Bend the leads slightly to secure the part.

4. Make sure that the soldering iron has warmed up and if necessary, use the damp sponge to clean the tip.

5. Place the soldering iron on the pad.

6. Using your free hand, feed the end of the solder onto the pad (top picture).

7. Remove the solder, then the soldering iron.

8. Leave the joint to cool for a few seconds.

9. Using a pair of cutters, trim the excess component lead (middle picture).

10. If you make a mistake heat up the joint with the soldering iron, whilst the solder is molten, place the tip of your solder extractor by the solder and push the button (bottom picture).

Solder joints

| Good solder joint | Too little solder | Too much solder |
Resistor Values

A resistor is a device that opposes the flow of electrical current. The bigger the value of a resistor, the more it opposes the current flow. The value of a resistor is given in Ω (ohms) and is often referred to as its ‘resistance’.

Identifying resistor values

<table>
<thead>
<tr>
<th>Band Colour</th>
<th>1st Band</th>
<th>2nd Band</th>
<th>Multiplier x</th>
<th>Tolerance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Silver</td>
<td></td>
<td></td>
<td>+ 100</td>
<td>10%</td>
</tr>
<tr>
<td>Gold</td>
<td>0</td>
<td>0</td>
<td>+ 10</td>
<td>5%</td>
</tr>
<tr>
<td>Black</td>
<td>1</td>
<td>1</td>
<td>10</td>
<td>1%</td>
</tr>
<tr>
<td>Brown</td>
<td>2</td>
<td>2</td>
<td>100</td>
<td>2%</td>
</tr>
<tr>
<td>Orange</td>
<td>3</td>
<td>3</td>
<td>1,000</td>
<td></td>
</tr>
<tr>
<td>Yellow</td>
<td>4</td>
<td>4</td>
<td>10,000</td>
<td></td>
</tr>
<tr>
<td>Green</td>
<td>5</td>
<td>5</td>
<td>100,000</td>
<td></td>
</tr>
<tr>
<td>Blue</td>
<td>6</td>
<td>6</td>
<td>1,000,000</td>
<td></td>
</tr>
<tr>
<td>Violet</td>
<td>7</td>
<td>7</td>
<td></td>
<td></td>
</tr>

<td>Grey</td>
<td>8</td>
<td>8</td>
<td></td>
<td></td>
</tr>
<tr>
<td>White</td>
<td>9</td>
<td>9</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Example: Band 1 = Red, Band 2 = Violet, Band 3 = Orange, Band 4 = Gold

The value of this resistor would be:
2 (Red) 7 (Violet) x 1,000 (Orange) = 27 x 1,000
= 27,000 with a 5% tolerance (gold)
= 27KΩ

Resistor identification task

Calculate the resistor values given by the bands shown below. The tolerance band has been ignored.

<table>
<thead>
<tr>
<th>1st Band</th>
<th>2nd Band</th>
<th>Multiplier x</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Brown</td>
<td>Black</td>
<td>Yellow</td>
<td></td>
</tr>
<tr>
<td>Green</td>
<td>Blue</td>
<td>Brown</td>
<td></td>
</tr>
<tr>
<td>Brown</td>
<td>Grey</td>
<td>Yellow</td>
<td></td>
</tr>
<tr>
<td>Orange</td>
<td>White</td>
<td>Black</td>
<td></td>
</tr>
</tbody>
</table>

Too many zeros?

Kilo ohms and mega ohms can be used:

1,000Ω = 1K
1,000K = 1M
Calculating resistor markings

Calculate what the colour bands would be for the following resistor values.

<table>
<thead>
<tr>
<th>Value</th>
<th>1st Band</th>
<th>2nd Band</th>
<th>Multiplier x</th>
</tr>
</thead>
<tbody>
<tr>
<td>180 Ω</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>3,900 Ω</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>47,000 (47K) Ω</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1,000,000 (1M) Ω</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

What does tolerance mean?

 Resistors always have a tolerance but what does this mean? It refers to the accuracy to which it has been manufactured. For example if you were to measure the resistance of a gold tolerance resistor you can guarantee that the value measured will be within 5% of its stated value. Tolerances are important if the accuracy of a resistor’s value is critical to a design’s performance.

Preferred values

There are a number of different ranges of values for resistors. Two of the most popular are the E12 and E24. They take into account the manufacturing tolerance and are chosen such that there is a minimum overlap between the upper possible value of the first value in the series and the lowest possible value of the next. Hence there are fewer values in the 10% tolerance range.

| E-12 resistance tolerance (± 10\%) |
|---|---|---|---|---|---|---|---|---|---|
| 10 | 12 | 15 | 18 | 22 | 27 | 33 | 39 | 47 | 56 | 68 | 82 |

| E-24 resistance tolerance (± 5 \%) |
| 10 | 11 | 12 | 13 | 15 | 16 | 18 | 20 | 22 | 24 | 27 | 30 | 33 | 36 | 39 | 43 | 47 | 51 | 56 | 62 | 68 | 75 | 82 | 91 |
Capacitor Basics

What is a capacitor?

A capacitor is a component that can store electrical charge (electricity). In many ways, it is like a rechargeable battery.

A good way to imagine a capacitor is as a bucket, where the size of the base of the bucket is equivalent to the capacitance (C) of the capacitor and the height of the bucket is equal to its voltage rating (V).

The amount that the bucket can hold is equal to the size of its base multiplied by its height, as shown by the shaded area.

Filling a capacitor with charge

When a capacitor is connected to an item such as a battery, charge will flow from the battery into it. Therefore the capacitor will begin to fill up. The flow of water in the picture above left is the equivalent of how the electrical charge will flow in the circuit shown on the right.

The speed at which any given capacitor will fill depends on the resistance (R) through which the charge will have to flow to get to the capacitor. You can imagine this resistance as the size of the pipe through which the charge has to flow. The larger the resistance, the smaller the pipe and the longer it will take for the capacitor to fill.

Emptying (discharging) a capacitor

Once a capacitor has been filled with an amount of charge, it will retain this charge until it is connected to something into which this charge can flow.

The speed at which any given capacitor will lose its charge will, like when charging, depend on the resistance (R) of the item to which it is connected. The larger the resistance, the smaller the pipe and the longer it will take for the capacitor to empty.

Maximum working voltage

Capacitors also have a maximum working voltage that should not be exceeded. This will be printed on the capacitor or can be found in the catalogue the part came from. You can see that the capacitor on the right is printed with a 10V maximum working voltage.
Ceramic Disc Capacitors

Values

The value of a capacitor is measured in Farads, though a 1 Farad capacitor would be very big. Therefore we tend to use milli Farads (mF), micro Farads (µF), nano Farads (nF) and pico Farads (pF). A µF is a millionth of a Farad, 1µF = 1000 nF and 1nF = 1000 pF.

The larger electrolytic capacitors tend to have the value printed on the side of them along with a black band showing the negative lead of the capacitor.

Other capacitors, such as the ceramic disc capacitor shown on the right, use a code. They are often smaller and may not have enough space to print the value in full, hence the use of the 3-digit code. The first 2 digits are the first part of the number and the third digit gives the number of zeros to give its value in pF.

Example: 104 = 10 + 0000 (4 zero’s) = 100,000 pF (which is also 0.1 µF)

Work out what value the four capacitors are in the table below.

<table>
<thead>
<tr>
<th>Printing on capacitor</th>
<th>Two digit start</th>
<th>Number of zero’s</th>

Evaluation

It is always important to evaluate your design once it is complete. This will ensure that it has met all of the requirements defined in the specification. In turn, this should ensure that the design fulfils the design brief.

Check that your design meets all of the points listed in your specification.

Show your product to another person (in real life this person should be the kind of person at which the product is aimed). Get them to identify aspects of the design, which parts they like and aspects that they feel could be improved.

<table>
<thead>
<tr>
<th>Good aspects of the design</th>
<th>Areas that could be improved</th>

</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Improvements

Every product on the market is constantly subject to redesign and improvement. What aspects of your design do you feel you could improve? List the aspects that could be improved and where possible, draw a sketch showing the changes that you would make.
Packaging Design

If your product was to be sold in a high street electrical retailer, what requirements would the packaging have? List these giving the reason for the requirement.

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Develop a packaging design for your product that meets these requirements. Use additional pages if required.

STEREO AMPLIFIER KIT

ESSENTIAL INFORMATION

BUILD INSTRUCTIONS
CHECKING YOUR PCB & FAULT-FINDING
MECHANICAL DETAILS
HOW THE KIT WORKS
Build Instructions

Before you start, take a look at the Printed Circuit Board (PCB). The components go in the side with the writing on and the solder goes on the side with the tracks and silver pads.

1. Place Resistors

Start with the six resistors:
The text on the PCB shows where R1, R2 etc go.
Ensure that you put the resistors in the right place.

<table>
<thead>
<tr>
<th>PCB Ref</th>
<th>Value</th>
<th>Colour Bands</th>
</tr>
</thead>
<tbody>
<tr>
<td>R1 &amp; R2</td>
<td>10K</td>
<td>Brown, black, orange</td>
</tr>
<tr>
<td>R3 &amp; R4</td>
<td>4.7Ω</td>
<td>Yellow, purple, gold</td>
</tr>
<tr>
<td>R5 &amp; R6</td>
<td>100K</td>
<td>Brown, black, yellow</td>
</tr>
</tbody>
</table>

2. Solder the IC Holder

Solder the Integrated Circuit (IC) holder in to IC1. When putting this into the board, be sure to get it the right way around. The notch on the IC holder should line up with the notch on the lines marked on the PCB. Once this has been done insert the 8 pin IC into this socket, making sure that the notch on the device matches the notch on the IC holder.

3. Solder the Ceramic Disc Capacitors

There are two ceramic disc capacitors (as shown right). These should be soldered into C6 and C7. It does not matter which way around they go.

4. Solder the Electrolytic Capacitors

Now solder in the five electrolytic capacitors (an example is shown right). The capacitors have text printed on the side that indicates their value. The capacitors are placed as:
C1 and C2 = 100μF, C3 = 10μF, C4 and C5 = 470μF.
Make sure that the capacitors are the correct way around. The capacitors have a '-' sign marked on them, which should match the same sign on the PCB.

5. Connect the Speakers

The kit is supplied with a meter of twin cable. This cable will be used to connect the two speakers. You will need to cut this to the required length for each speaker in your enclosure design.
Take each piece of wire that you have cut off and strip the ends of the wire. Connect one end of each to the two terminals on the speaker (shown right) and the other end of each to the terminals on the PCB marked ‘SPEAKER1’ and ‘SPEAKER2’, after feeding it through the strain relief hole. It does not matter which way around these connections go.
ATTACH THE BATTERY CLIP

The PP3 battery clip should be attached to the terminals labelled ‘POWER’. Connect the red wire to ‘+’ and the black wire to ‘-’ after feeding it through the strain relief hole.

CONNECT THE AUDIO CABLE

The stereo Jack lead should be connected to the ‘INPUT’ terminal. First, feed the wires through the strain relief hole. The black wire should be connected to the terminal labelled ‘BLK’. The other two can go the either of the two remaining inputs.

Checking Your Amplifier PCB

Carefully check the following before you insert the batteries:

Audio equipment may become damaged if connected to an incorrectly built amplifier.

Check the bottom of the board to ensure that:

- All holes (except the 4 large (3mm) holes in the corners) are filled with the lead of a component.
- All these leads are soldered.
- Pins next to each other are not soldered together.

Check the top of the board to ensure that:

- The four wires are connected to the right place.
- The ‘-’ on the capacitors match the same marks on the PCB.
- The colour bands on R1 & R2 are brown, black, orange.
- The colour bands on R3 & R4 are yellow, purple, gold.
- C3 is a 10μF capacitor.
- The battery clip red and black wires match the red and black text on the PCB.
- The notch on the IC is next to C1 & C4.
Adding an On / Off Switch

If you wish to add a power switch, don’t solder both ends of the battery clip directly into the board, instead:

1. Solder one end of the battery clip to the PCB, either black to ‘-’ or red to ‘+’.

2. Solder the other end of the battery clip to the on / off switch.

3. Using a piece of wire, solder the remaining terminal on the on / off switch to the remaining power connection on the PCB.
Fault finding flow chart

Start
Power up the board with it connected to a music source

Are the speakers making any kind of sound?

Yes

No

Is the speaker playing the music clearly?

Yes

Check
- The black jack wire, R1 & R2 for dry joints
- R1, R2, R3 & R4 are in the correct place

Is the sound coming out of both speakers?

Yes

Check
- IC1 is in the right way around
- For dry joints on the power connectors
- The input connector is in the right place and the red and black wire are the correct way around
- IC1 for dry joints on pins 2 & 4
- C3 and IC1 pins 3 & 4 for shorts

Speaker 1
Which speaker is their no sound from?

Speaker 2

Check
- The wire connections on speaker 2 for dry joints on the PCB and speaker
- The black jack wire is in the Blk ‘Input’ connection and In2 for a dry joint
- R6, C5 & IC1 pins 3 & 6 for dry joints
- R2 is in the correct place
- C2 and IC1 pins 2 & 3, 5 & 6 for shorts

Check
- The wire connections on speaker 1 for dry joints on the PCB and speaker
- The black jack wire is in the Blk ‘Input’ connection and In1 for a dry joint
- R5, C4 & IC1 pins 1 & 7 for dry joints
- R1 is in the correct place
- C1 and IC1 pins 1 & 2, 7 & 8 for shorts

No it’s loud or distorted

Is one of the speakers very quiet?

Yes

Check
- For a dry joint on C1, R2 or IC1 pins 5 & 6

No

Check
- The black jack wire, R1 & R2 for dry joints
- R1, R2, R3 & R4 are in the correct place

Stop
Designing the Enclosure

When you design the enclosure, you will need to consider:

- The size of the PCB (below left, height including components = 15mm).
- How big the batteries are.
- How to mount the two speakers (below right).
- How to allow the audio cable out of the box.
- Are you making the amplifier for a particular MP3 player, if so should the MP3 player go in the box?

These technical drawings of the amplifier PCB and speaker should help you to plan this.

### Mounting the PCB to the enclosure

The drawing to the left shows how a hex spacer can be used with two bolts to fix the PCB to the enclosure.

*Your PCB has four mounting holes designed to take M3 bolts.*
How the Amplifier Works

At the centre of the circuit is an audio amplifier Integrated Circuit or IC. Inside the IC are lots of transistors, which are connected together to allow the small input signal to be amplified into a more powerful output that can drive a speaker.

All amplifiers need to use feedback to ensure that the amount of gain stays the same. This allows the output to be an exact copy of the input, just bigger. The gain is the number of times bigger the output is compared to the input. So if an amplifier has a gain of 10 and there is 1 volt on the input, there will be 10 volts on the output. An operational amplifier has two inputs, these are called the inverting (-) and non-inverting (+) inputs. The output of the operational amplifier is the voltage on the non-inverting input less the voltage on the inverting input, multiplied by the amplifier’s gain. In theory, an operational amplifier has unlimited gain so if the non-inverting input is a fraction higher than the inverting input (there is more + than -), the output will go up to the supply voltage. Change the inputs around and the output will go to zero volts. In this format the operational amplifier is acting as a comparator, it compares the two inputs and changes the output accordingly.

With an infinite gain the amplifier is no good to amplify audio, which is where the feedback comes in. By making one of the inputs a percentage of the output the gain can be fixed, which allows the output to be a copy of the input but bigger. Now when the two inputs are compared and the output is adjusted, instead of it going up or down until it reaches 0 volts or V+, it stops at the point when the two inputs match and the output is at the required voltage.

Looking at the circuit diagram for the audio amplifier – it’s not obvious where the feedback is, this is because it is inside the IC. The TDA2822M or NJM2073D chip has fixed the gain so the output is about 90 times bigger than the input. To make the gain useful in our application, there is a potential divider on each channel that is fed into the IC (R1+R5 and R2+R6). Each of these reduces the input signal to only 10% of the original signal. This, therefore, reduces the overall gain of the amplifier to about 9 times the input to the circuit.

C3 is connected across the supply to make sure that it remains stable. The other capacitors have a filtering role, either to cut out high frequency noise or get the best out of the speaker.
Online Information

Two sets of information can be downloaded from the product page where the kit can also be reordered from. The ‘Essential Information’ contains all of the information that you need to get started with the kit and the ‘Teaching Resources’ contains more information on soldering, components used in the kit, educational schemes of work and so on and also includes the essentials. Download from:
